

Virtual Atom Smasher

*A game for doing real
high-energy physics analysis*

Ioannis Charalampidis, Peter Skands & Francois Grey

Contents

- A. Context: Citizen Science on the Web, from LHC@home to Virtual Atom Smasher.
- B. Prototype: Introduction to the current status of Virtual Atom Smasher.
- C. Mission: How you can contribute!

A Context

In 2004, CERN launched “volunteer computing” project **LHC@home** running the application Sixtrack.

To date **>100,000 people** have downloaded and run the software.

They have contributed processing power to **simulations of proton orbit stability** in the LHC.

A Context

In 2011, CERN launches new LHC@home volunteer computing application **Test4Theory**,

First volunteer computing application to use **virtual machine (VM) technology, CernVM**. Enables HEP simulation to run in laptop/desktop environments.

A Context

In 2010, Peter Skands gives 15-year-old summer intern a challenge: **tune parameters for Monte Carlo simulation**.

In a week, Mikkel Jeppsson gets excellent tune quality, suggesting **analogy with protein folding game** FoldIt.

2012: Virtual Atom Smasher conceived as pilot application for EC project about learning and creativity in citizen science, called **Citizen Cyberlab**.

B Prototype

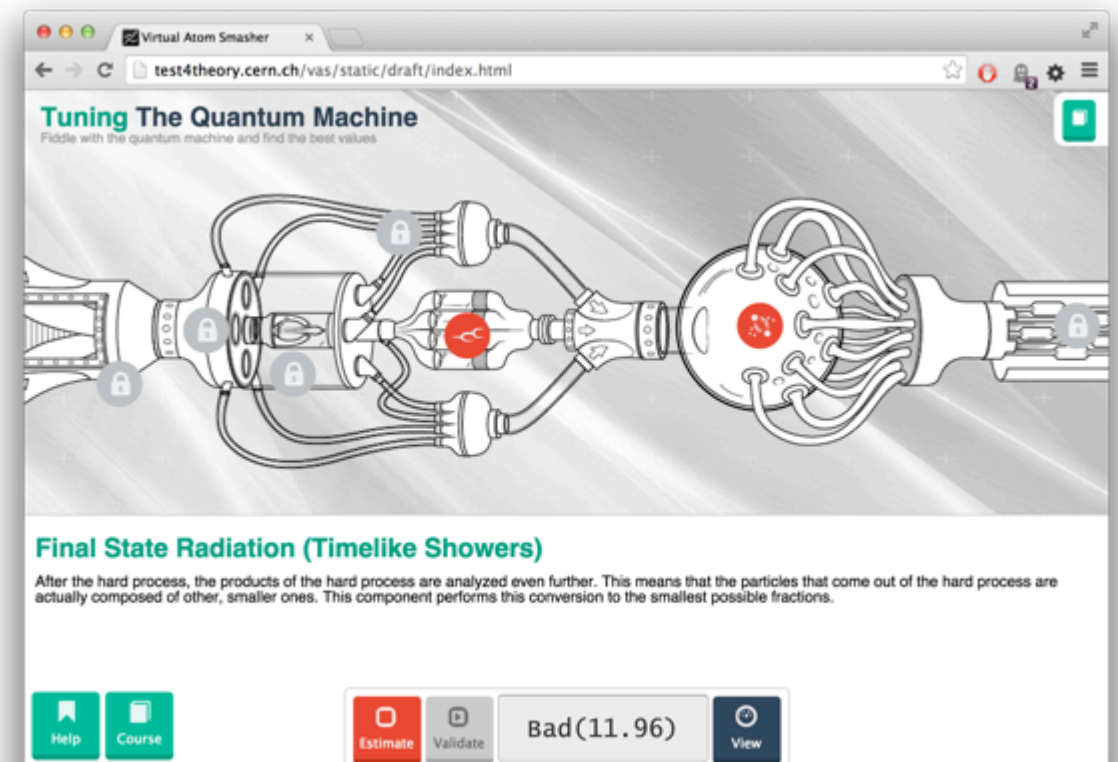

CERN Public Computing Challenge 12/2014 tests simpler approach to VM distribution, [CernVM WebAPI](#).

Behind the scenes: [analytics of site traffic](#) to track user behaviour and improve experience.

In 12 days, [8000 users](#), 16,000 session 5400 run VMs, >80% finish a simulation successfully.

B Prototype

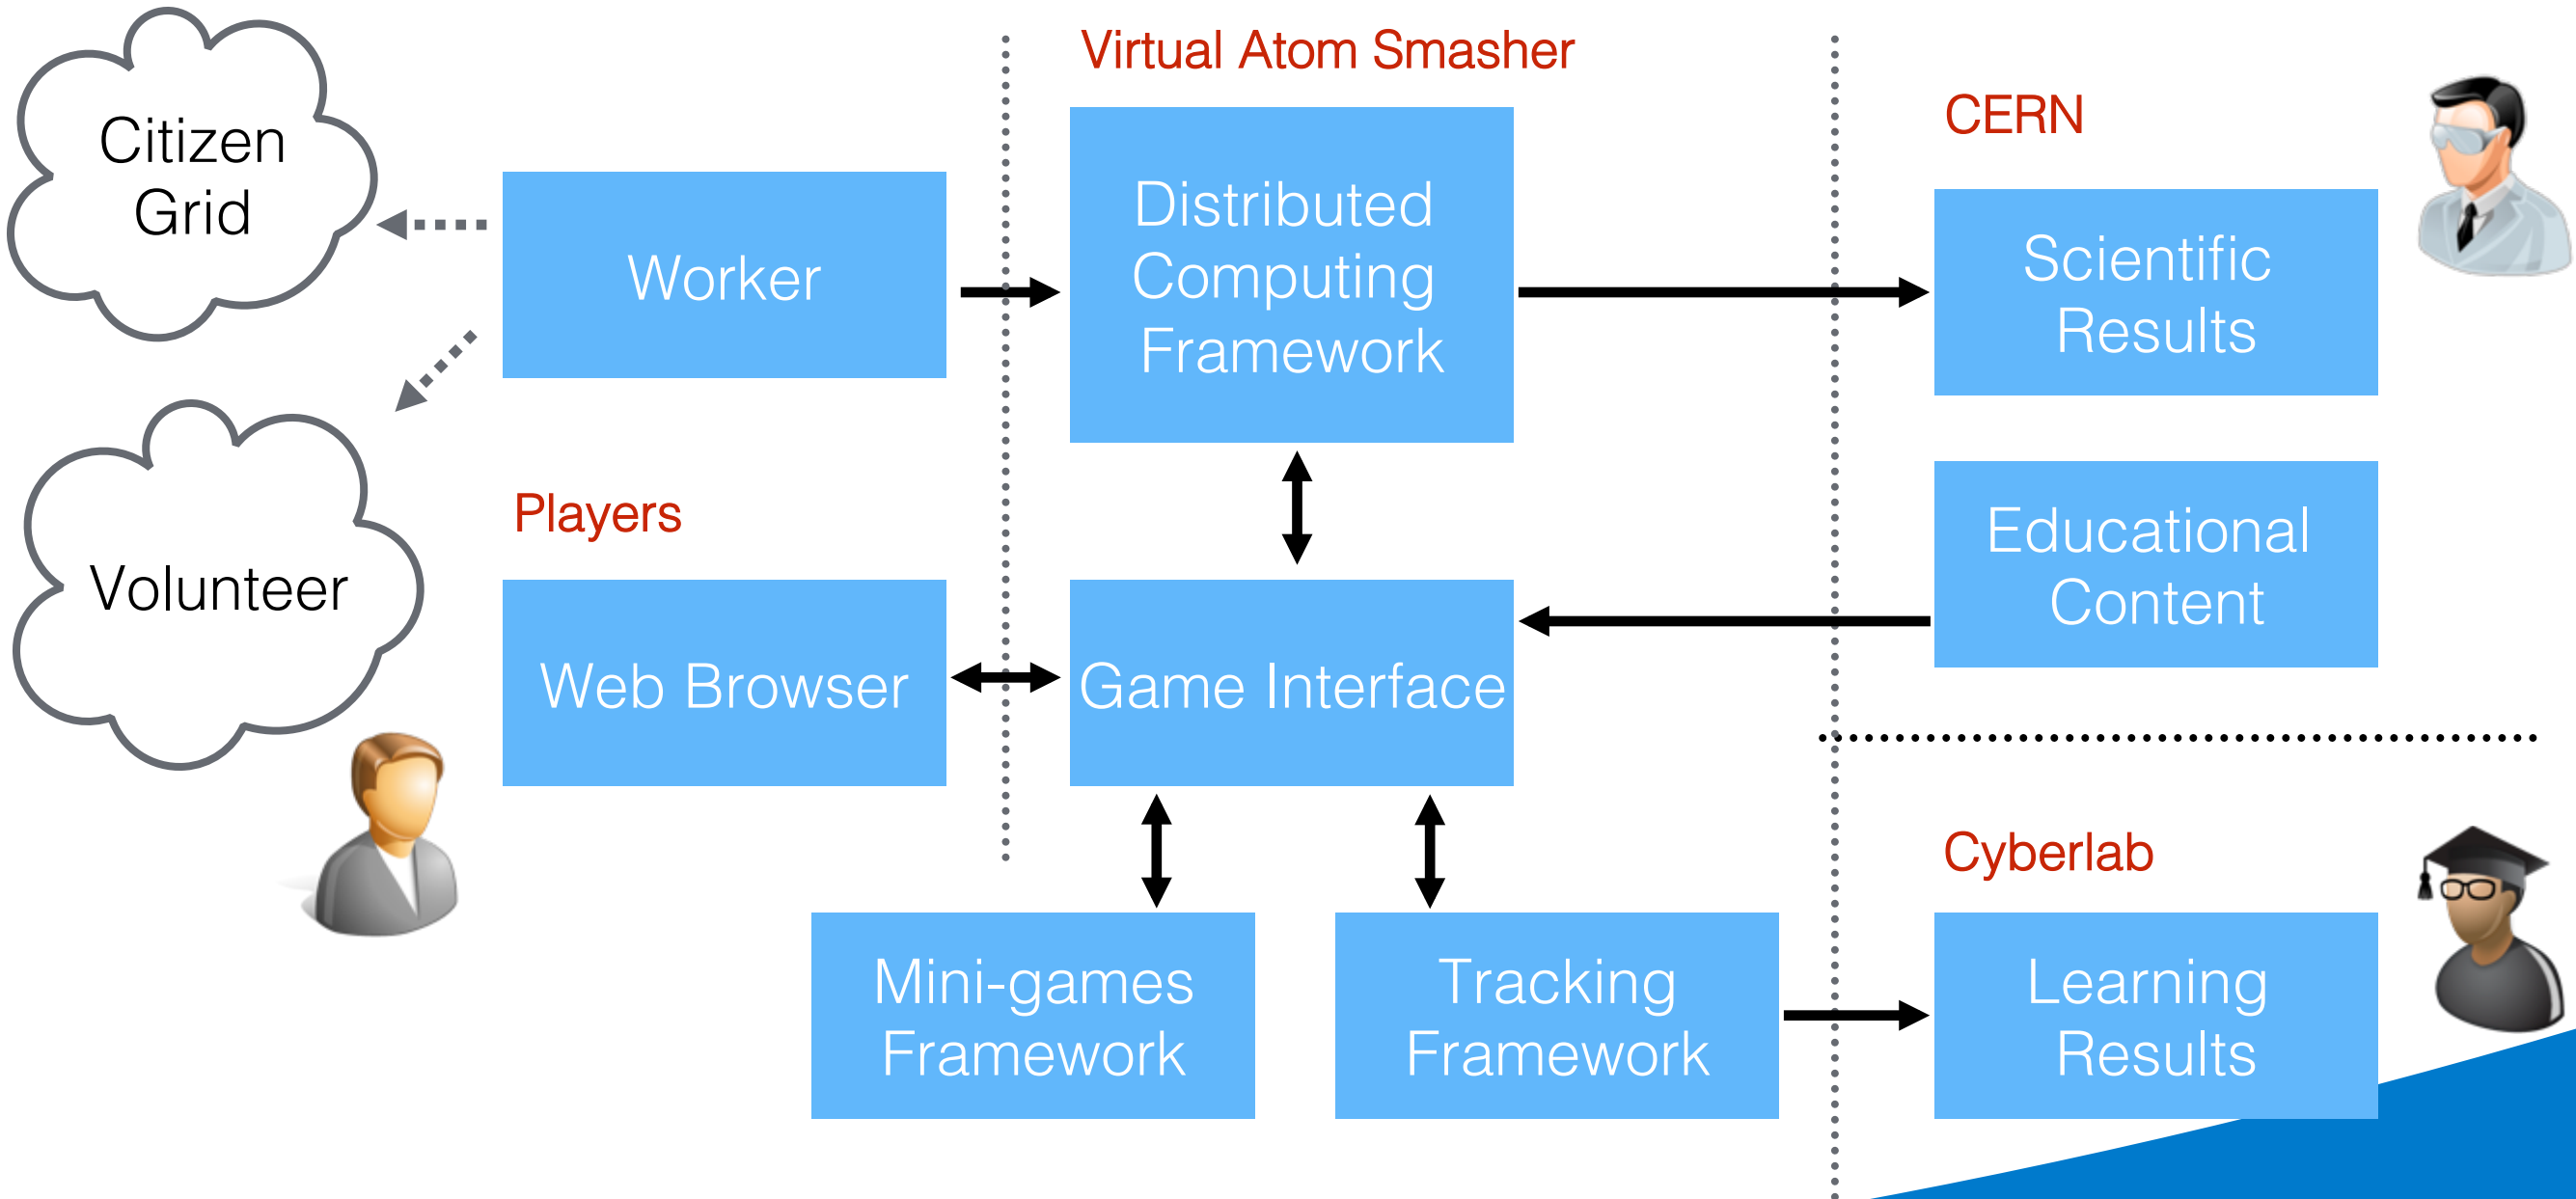

Development of Virtual Atom Smasher by Ioannis Charalampidis at CERN, with **input from interface and online learning experts** in Citizen Cyberlab.

Core concept: turn abstract tuning process into concrete “**Quantum Machine**”, lead player through learning activities to unlock levels of the game.

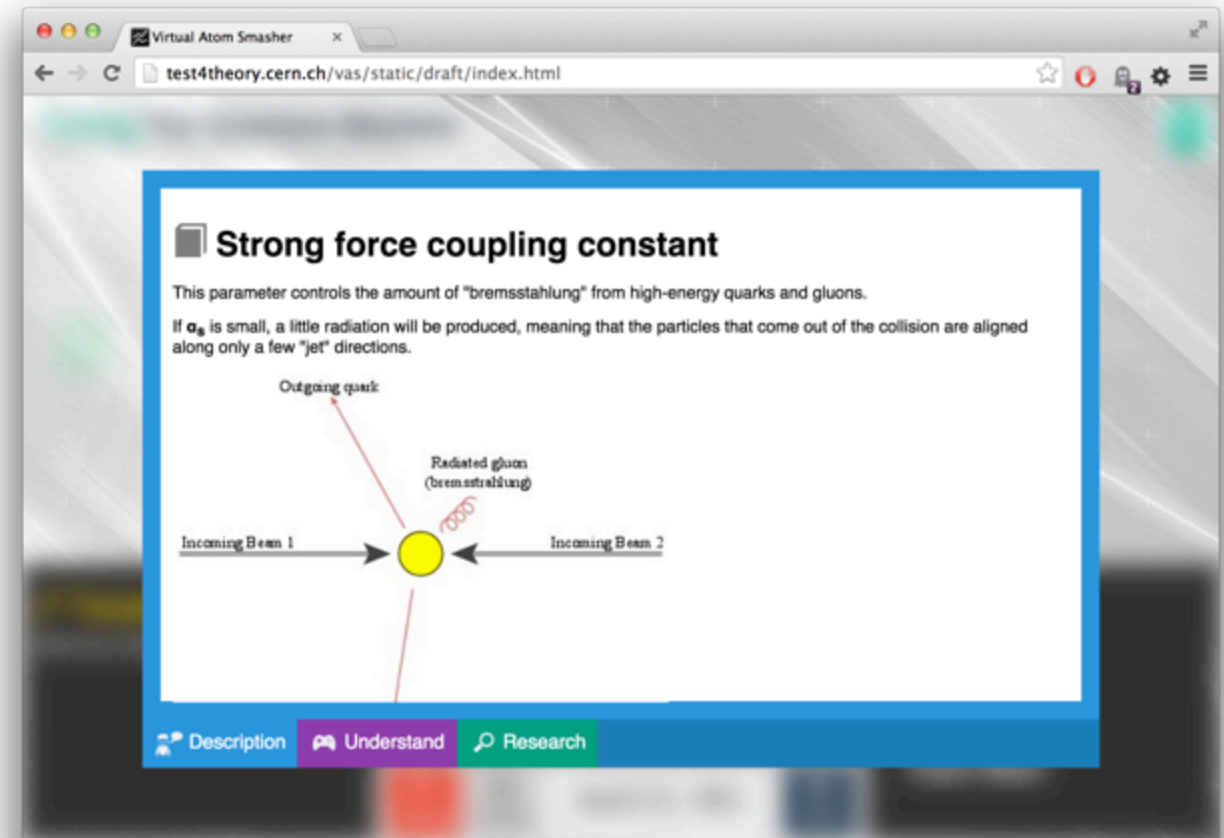

B Prototype

Institutions

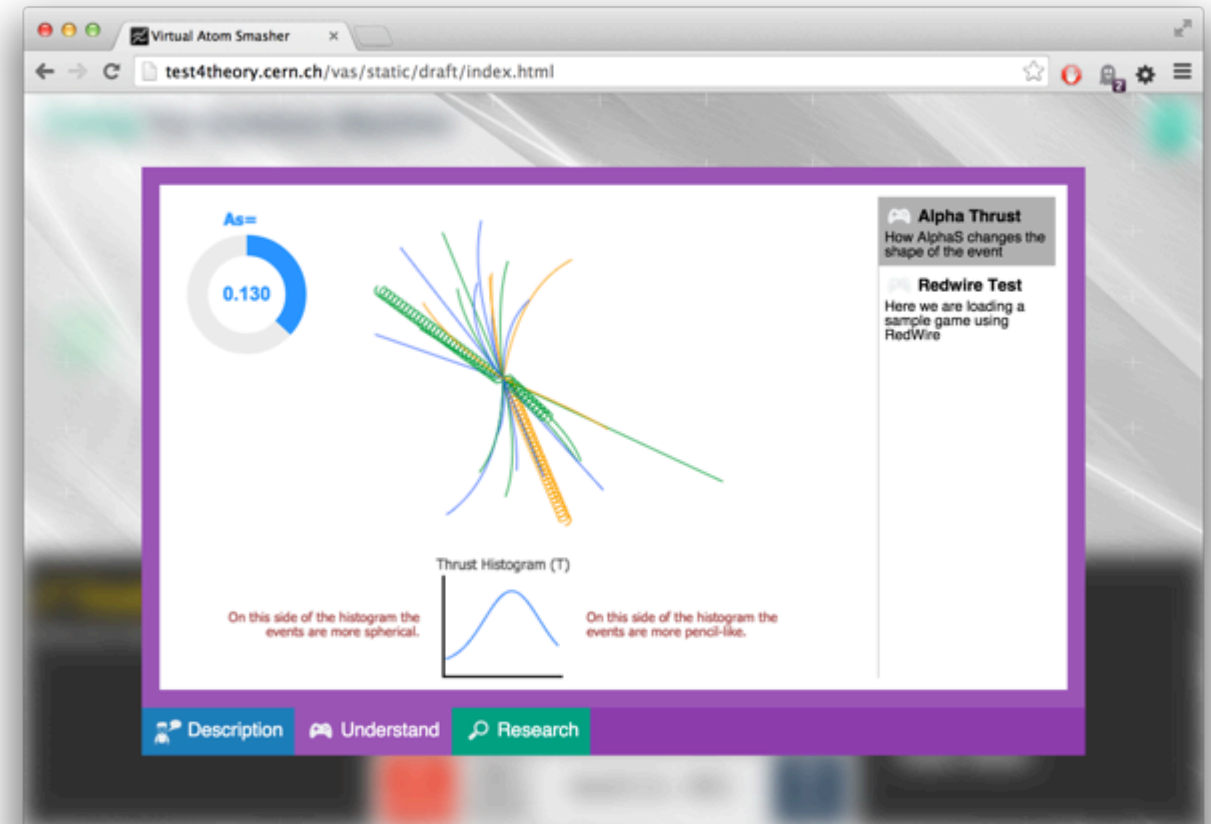

- Help us test this **pilot project** for **measuring** learning and creativity in citizen science.
- **Basic level:** Give us feedback to improve the way players **learn** how to tune Monte-Carlo simulations.
- **Team level:** **build a team** and help us test a new approach to volunteer computing.
- **Advanced level:** Use tools in the game to make your own **tutorials** and **mini-games** to teach others.

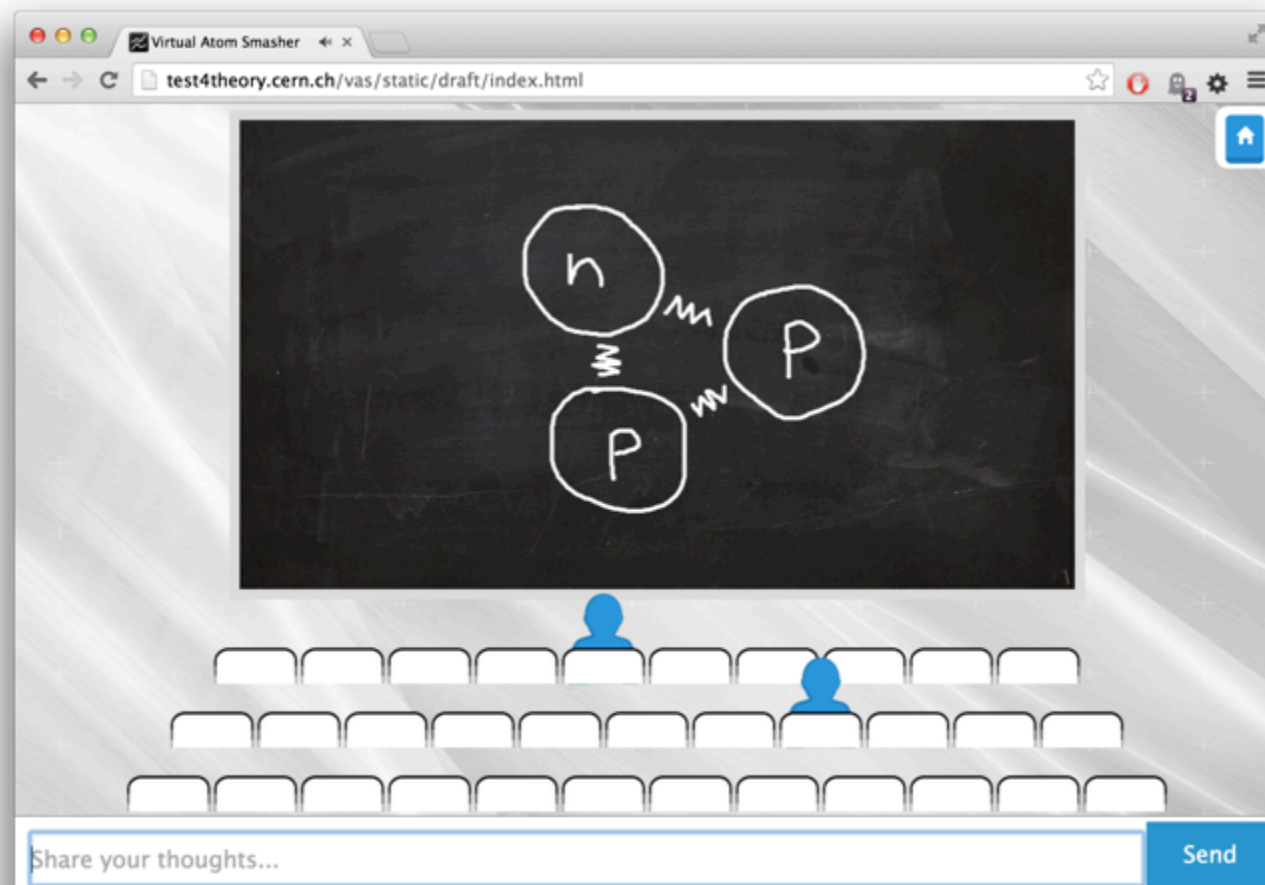

Evaluate Information On Demand

The user can pick the depth of information (s)he is comfortable with.

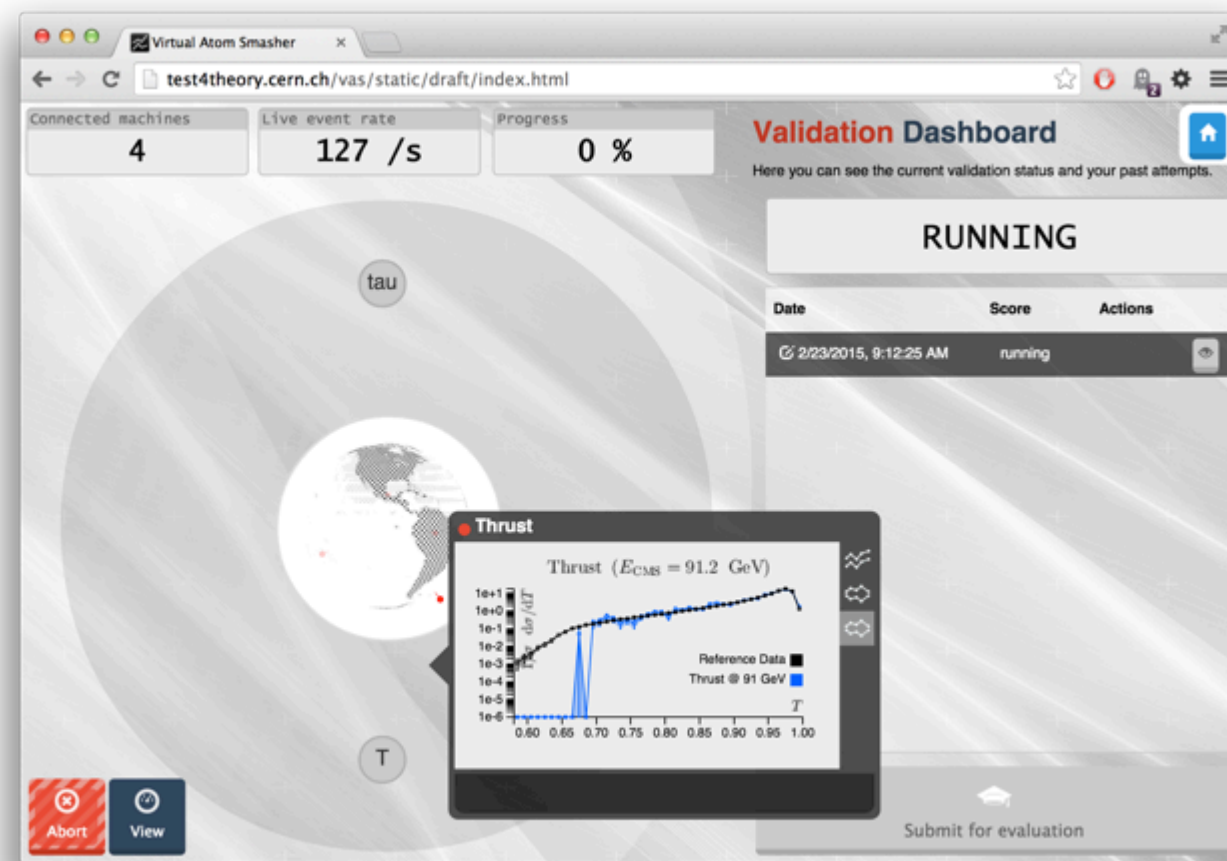

Play Mini Games

For the user to understand the particular topics, using open source mini-game design platform RedWire.

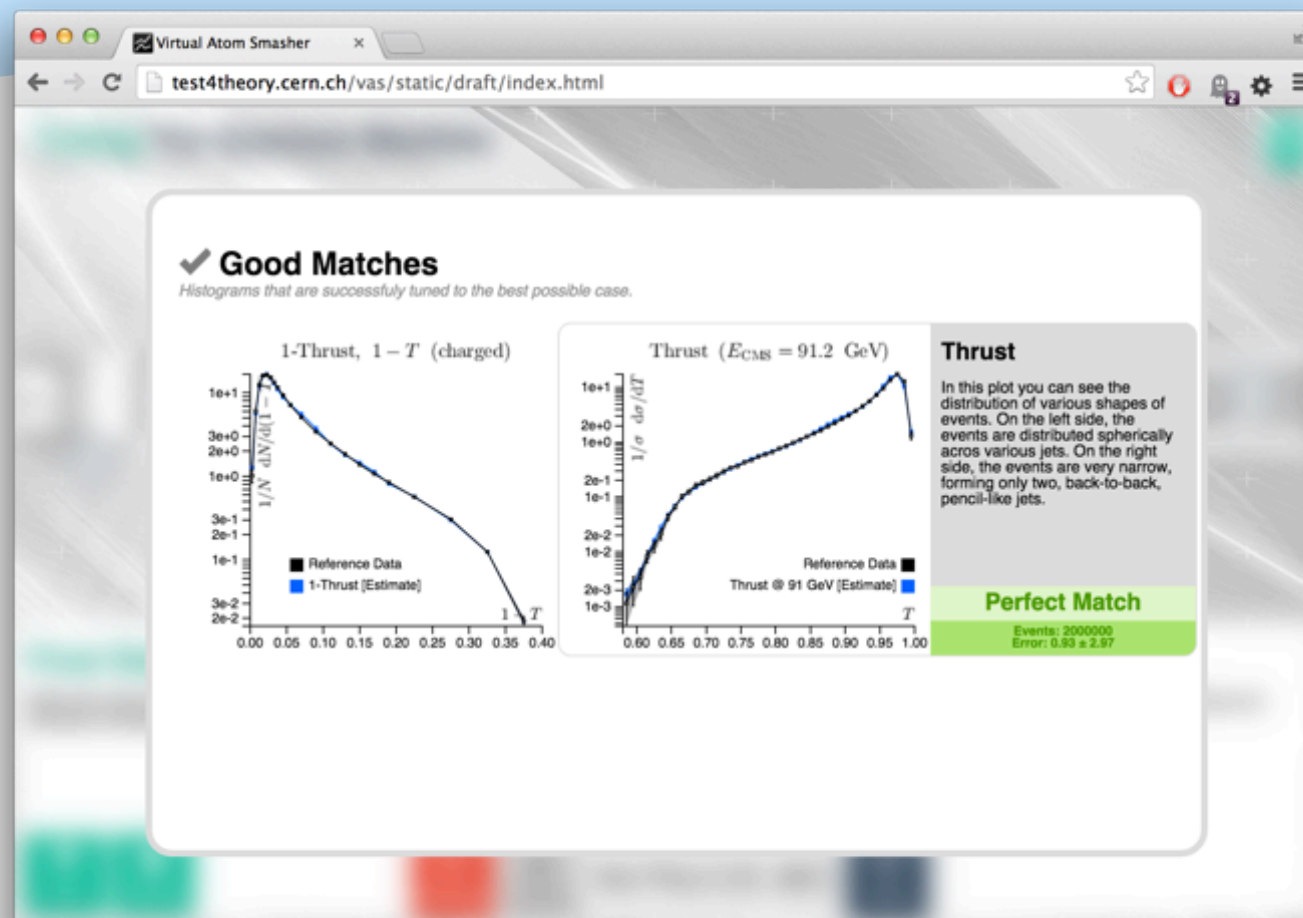

Follow Mini Tutorials

Using Tootr, a procedural presentation framework which players can use to edit, improve explanations.

Build volunteer computing teams

Run simulation jobs on a network of computers shared by friends and family. (In future) add resources from major institutions to your network.

Compare your simulations with real HEP data

Ultimately, the game will allow you and your team to provide fits that scientists at CERN and partner institutes will use in their research.

Mission
